

Fuse in the three-level distribution box

Overview

This picture shows the interior of a typical distribution panel in the United Kingdom. The three incoming phase wires connect to the busbars via a main switch in the centre of the panel. On each side of the panel are two, for neutral and earth. The incoming neutral connects to the lower busbar on the right side of the panel, which is in turn connected to the neutral busbar at the top left. The incoming earth wire connects to the earth busbar at the top right.

AI Overview

A three-level (three-way) distribution box with fuse is a three-phase electrical panel designed to safely distribute power across multiple circuits while protecting against overloads, short circuits, and surges.

Overview A three-level distribution box, also known as a three-phase distribution board, serves as a central hub for electricity in commercial, industrial, or large residential setups. It distributes power from the main supply to multiple circuits, ensuring each circuit receives the correct voltage and current. These boards typically include fuses or circuit breakers to protect circuits from overloads and short circuits, enhancing safety and reliability.

Key Features

- Three-Phase Configuration:** Balances the electrical load across three phases, improving efficiency and reducing voltage drops.
- Fuse Protection:** Each circuit is protected by a fuse, which interrupts the flow of electricity in case of overload or fault, preventing damage to equipment.
- Main Switch:** Allows complete isolation of the board for maintenance or emergencies.
- Surge Protection Device (SPD):** Protects connected equipment from voltage spikes and power surges.
- Multiple Ways:** Boards can have 3-way, 4-way, or up to 16-way circuit protection, depending on the model and application.
- Durable Construction:** Typically made from galvanized steel with powder coating for long-lasting performance.
- Ease of Wiring:** Designed for organized and safe wiring.
