

# Home router fiber optic connection not connected

## AI Overview

If your fiber optic router can't connect to the internet, the issue may be due to hardware, configuration, or ISP-related problems, and can often be resolved with systematic troubleshooting.

**Step 1: Check Physical Connections** Ensure that all cables are securely connected. The fiber optic cable should be properly plugged into the modem, and the Ethernet cable should connect the modem to your router. Inspect cables for visible damage, fraying, or sharp bends, as these can disrupt the signal. Make sure the router is plugged directly into a working electrical outlet and that the power light is green.

**Step 2: Verify Router and Modem Status** Check the indicator lights on your router and modem. A solid green or blinking white light usually indicates a proper connection, while red, amber, or off lights suggest a problem. If the WAN or Internet light is off or red, the router may not be receiving a signal from the modem.

**Step 3: Restart Devices** Power cycle your equipment by turning off the router and modem, waiting 30 seconds, and then turning them back on. This can clear temporary glitches and re-establish the connection.

**Step 4: Test Network Settings** Ensure your router is configured correctly. If your ISP provides a static IP, verify that the IP address, subnet mask, gateway, and DNS settings are correctly entered. Some routers may default to dynamic IP detection, which can fail if your ISP requires static settings. Also, confirm that your devices are connected to the correct network and using the proper password.

**Step 5: Test with a Direct Connection** Connect a computer directly to the fiber modem using an Ethernet cable. If the computer cannot access the internet, the issue may be with the ISP or modem rather than the router.

**Step 6: Replace or Swap Cables** If the Ethernet cable or fiber patch cord is faulty, replacing it with a known-good cable can resolve connectivity i...
