

How to access the core switch and view the IP address

Simplex SC UPC

AI Overview

You can view a core switch's IP address using console access, CLI commands, DHCP lookup, or network discovery tools. Direct Console Access The most reliable method is to connect directly to the switch's console port using a console cable and a terminal emulator like PuTTY or SecureCRT. Once connected, enter privileged EXEC mode and run the command `show ip interface brief` to display all configured IP addresses, including the management VLAN (usually VLAN 1) or any other VLAN assigned for management purposes. This method works for both Layer 2 and Layer 3 switches. Using CLI via SSH or Telnet If the switch is already reachable on the network, you can connect via SSH or Telnet. Commands such as `show mac address-table` combined with `show arp` allow you to trace the MAC address of a connected device to the switch port, and then use `show cdp neighbor detail` to find the management IP of the switch. On Huawei switches, the `display arp` command can show IP addresses of directly connected servers and the interfaces they are connected to. DHCP Server Lookup If the switch obtains its IP address via DHCP, you can check the DHCP server or router's lease table. Look for the switch's hostname or MAC address in the client list to identify its assigned IP. This method is useful when you do not have physical access to the switch. Network Scanning Tools Tools like Nmap or Angry IP Scanner can scan your network's IP range to identify connected devices. By matching MAC addresses or hostnames, you can locate the switch's IP address. This is particularly helpful in larger networks where multiple switches are deployed. Using CDP/LLDP If you have another Cisco device on the same network, Cisco Discovery Protocol (CDP) or Link Layer Discovery Protocol (LLDP) can reveal the IP address and other details of neighboring switches. This is useful for discovering core switches indirectly from co...
