

How to delete a zone on a fiber optic switch

AI Overview

To delete a zone on a fiber optic switch, you must remove it from the zoneset, deactivate the zoneset if necessary, delete the zone, and save the configuration.

Steps for Cisco MDS Switches

- Identify the Active Zoneset Use the command `show zoneset active | inc zoneset` to determine the active zoneset for the relevant VSAN.
- Deactivate the Zoneset (if required) If the zoneset is active, deactivate it using: `config t no zoneset activate name vsan` This ensures changes do not disrupt the fabric.
- Remove the Zone from the Zoneset Copy the active zoneset to a full zoneset for editing: `zone copy active-zoneset full-zoneset vsan` Then edit the zoneset to remove the specific zone: `CodeCopyzone name vsan no member` End the configuration with `CNTL/Z`.
- Reactivate the Zoneset After removing the zone, reactivate the zoneset to apply changes: `zoneset activate name vsan`.
- Save the Configuration Save the running configuration to startup configuration: `copy running-config startup-config`.

Steps for Brocade Switches

- Log in with Admin Privileges Connect to the switch and log in using an account with administrative permissions.
- Remove the Zone from the Configuration `CodeCopycfcfgremove "" ""` This removes the zone from the defined configuration.
- Delete the Zone from the Fabric `CodeCopyzoneddelete` This deletes the zone entirely from the fabric.
- Save and Enable the Configuration `CodeCopycfcfgsavecfcgenable ""` This commits the changes to nonvolatile memory and re-enables the configuration.
- Verification Use `show zone` or `show zoneset` commands to confirm the zone has been removed.

Ensure that hosts and devices are still able to communicate as expected after the deletion.

Important Considerations Always verify which VSAN or fabric the zone belongs to before deletion to avoid disrupting other switches. Deleting a zone may temporarily affect connecti...
