

Installation of fire-resistant and flame-retardant cable trays in Africa

Overview

Surfaces should be coated with fire-retardant paint to slow flame spread and increase heat resistance. Install fire barriers within the tray to isolate different fire zones. When cable trays pass through walls or floors, seal openings using fire-rated penetration. Fire retardant cables are specifically designed to resist the spread of flames and limit fire propagation along their length. Meka Pro has tested and continues to test its products and cable management systems' fire resistance with the cables installed and connected according to the temperature curve in the EN 1363-1. This document outlines the key requirements for cable tray layout, installation, and fireproofing in industrial and commercial environments. Route Planning and Layout Principles Coordinate with Building Structure: Cable tray routing should align with architectural design, avoiding unnecessary. Effective protection of cable systems around the world: our tried-and-tested FLAMMOTECT-A and DG-CR 0. Understanding IEC 60332 testing helps engineers, contractors, and project managers choose the right cable solutions to limit flame.
