

Is the optical module single-wavelength or multi-wavelength

Overview

Generally, multi-mode optical modules work at 850 nm wavelength, whereas single-mode optical modules work at 1310 nm or 1550 nm. The secret lies in fiber optic technology, and understanding the basics—1-core, 2-core, Single Mode (SM), and Multi-mode (MM)—is key to mastering this field. Let's break down these terms in simple, clear language with practical examples. Think about distance, speed, fiber you have. When engineers search for “SFP wavelength,” they are typically trying to answer a practical deployment question: Which optical wavelength should I use—850 nm, 1310 nm, or 1550 nm—and why does it matter?

The answer directly affects fiber compatibility, transmission distance, link stability, and. Bidirectional (BiDi) optical module: An optical module that transmits data through only one fiber. Its primary function is to achieve optoelectronic conversion by converting electrical signals into optical signals and vice versa.
