

Partition plate for the interlayer of the distribution box

AI Overview

Partition plates are steel or metal dividers used inside distribution boxes to separate circuits or components, enhancing safety and organization. Purpose and Function Partition plates, also called device box dividers, are installed inside distribution boxes to create separate compartments for electrical components. They help prevent short circuits, improve airflow, and allow organized wiring layouts. These plates are particularly useful in deep gangable boxes or multi-layered distribution panels, where multiple circuits or devices need physical separation for safety and maintenance purposes. Materials and Types Most partition plates are made of steel or aluminium, providing durability and electrical insulation when properly coated. They come in various sizes to fit standard outlet or distribution boxes, including depths of 2 inches, 2-1/2 inches, and 3 inches. Some plates are designed for specific series of boxes, such as the ABB 1104 and 3104 series, ensuring compatibility. Installation and Compatibility ABB CI1104-P Iberville: Steel partition plate suitable for deep gangable boxes, compatible with 1104 and 3104 series. RACO Data Box Partition Plate: Steel plate for general electrical box applications, available through suppliers like Grainger. Rittal Mounting Plates: Partial or full mounting plates that can create additional surfaces inside enclosures, adaptable to width, height, or depth requirements. Selection Considerations When choosing a partition plate for a distribution box interlayer, consider: Box series and dimensions to ensure proper fit. Material for durability and electrical safety. Depth and thickness to accommodate wiring and devices. Mounting method (screw-in, snap-in, or adjustable) for ease of installation. Using the correct partition plate ensures organized, safe, and code-compliant electrical installations, especially in residential, commercial, or industrial...
