

Performance of the optical transmitter

Overview

The core of an optical transmitter is a light source, typically a laser diode or a light-emitting diode (LED). The choice between these depends on the required data rate and transmission distance. Laser diodes, offering superior performance, are the preferred choice for most. Optical transmitters are a crucial component in modern telecommunications, enabling the transmission of data as light signals through optical fibers. In this comprehensive guide, we will explore the definition, importance, and evolution of optical transmitters, as well as their types, applications. The second paper proposes a co-packaged and fiber-terminated VCSEL-based optical transmitter, which, with the aid of a complex-zero CTLE and low-power clocking scheme, achieves a data rate of 64Gb/s while maintaining low power consumption. As design/test margins get tighter, the challenges of making accurate and repeatable extinction ratio measurements become more apparent. E DFA is used for amplification of the signal.
