

Shock-absorbing distribution box

Overview

A rack pallet, also known as a shock pallet, is a specialized type of pallet with shock absorbing foam placed between the bottom runners and the deck of the pallet. This cushioning foam helps to absorb and distribute shock forces during the transportation and handling of goods. The invention discloses an annular shock-absorbing distribution box which comprises a rod body, a shell and a base, wherein the base is fixedly connected to the rod body; the upper surface of the base is also provided with a shock absorption device; the rod body is sleeved with an inner ring which. The invention discloses a kind of distribution boxes with shock-absorbing function, including fixed frame, the inner wall of the fixed frame is fixedly connected there are two symmetrical sliding rail, the inside of the sliding rail is connected with the first sliding block, the described one end of. Choose the right vibration-damping mounts to protect equipment from damage and reduce noise. In the distribution box, there are button switch equipment and measuring instruments assembled. Our Shock Mount and Rack Pallets deliver a heightened level of protection by both securely holding items in place and reducing the damaging effects of everyday supply chain handling, including warehousing, trucking, rail, and air transport.
