

# Why are some optical ports on industrial switches unusable

## Overview

Make sure the ports on the devices that are connected together are both SMF, or both are MMF ports. Connections for transmit-to-transmit and. Why is no connection established between the communication partners on an optical transmission path?

There can be various reasons if no connection is established between the communication partners even though there is an optical connection. In addition to electrical cables, which are usually made. If you have physical access to the switch, it can save time to look at the port LEDs which give you the link status or can indicate an error condition (if red or orange). The table describes the LED status indicators for Ethernet modules or fixed-configuration switches: Ensure that both sides have. This article introduces two optical ports of industrial Ethernet switches and what is the role of optical ports of the industrial switch. DTP has been disabled as well, and STP Root Guard and BPDU Guard are enabled.
